ABSTRACT

Inventory management is a critical function for any business, as it directly impacts sales efficiency, operational cost, and decision-making. Many small and medium-sized businesses still rely on manual methods or scattered digital tools, which often lead to stock mismanagement, data inconsistency, and limited visibility into sales performance. This project addresses these challenges by developing a web-based **Inventory Management System** that provides a centralized, secure, and user-friendly platform for managing products and sales activities.

The system is designed as a full-stack application using **React** for the frontend, **Node.js** for backend logic, and **MongoDB** for data storage. It enables authenticated users to perform essential inventory operations such as adding, updating, and deleting products, recording sales transactions, and viewing real-time dashboards and sales history. Role-based access is simplified to a single authorized user type (Admin/Business Owner), ensuring controlled access and data integrity. The application follows a modular architecture, making it scalable and easy to maintain.

Overall, the project demonstrates how modern web technologies can be effectively integrated to build a reliable inventory solution that balances technical robustness with practical usability. It serves as a foundational system that can be further enhanced with advanced features such as analytics, multi-user roles, and cloud deployment, making it suitable for real-world business environments.
